

AMENDMENTS TO THE CLAIMS

Claims 1-19 (Cancelled)

20. (Currently amended) A holder for a mobile radio terminal, comprising:

a holder having an interface for connecting to an external antenna, and a coupling structure for electromagnetic coupling of RF signals between the holder and the external antenna of the mobile radio terminal which is located in the holder;

the coupling structure being arranged in the holder in such a way that, when the mobile radio terminal is inserted, the coupling structure is positioned underneath the mobile radio terminal in the vicinity of ~~the~~a mobile radio;

wherein the coupling structure is in the form of a two-layer or multilayer coupling structure with two or more coupling structure elements arranged one above the other on essentially mutually parallel planes, in which the two or more coupling structure elements are arranged one above the other and separated from one another by three to six millimeters, whereby a first coupling structure element comprises two differently shaped structure elements which are ~~intended~~ for different wavelength ranges;

wherein the first coupling structure element has two or more structure elements whose orientation directions are rotated through 90°.

21. (Previous presented) The holder of claim 20, wherein the antenna is a motor vehicle antenna.
22. (Cancelled)

23. (Previous presented) The holder as claimed in claim 20, wherein a second coupling structure element comprises two or more differently shaped structure elements which are coupled to one another.
24. (Previous presented) The holder as claimed in claim 20, wherein one coupling structure element is in each case composed of a conductive material which is applied to one face of a mount substrate.
25. (Previous presented) The holder of claim 24, wherein the mount substrate is a board.
26. (Previous presented) The holder as claimed in claim 24, wherein two or more structure elements composed of a conductive material are applied to the mount substrate and can be connected to one another for tuning.
27. (Previous presented) The holder as claimed in claim 26, wherein the structure elements are connected to one another by means of capacitors or coils
28. (Previous presented) The holder as claimed in claim 20, wherein the two or more coupling structure elements are each composed of a conductive material which is applied to a respectively associated thin dielectric mount substrate body and the dielectric mount substrate bodies are arranged one above the other, at a distance from one another.
29. (Currently amended) The holder as claimed in claim 28, wherein the holder has one or more electrical connection elements which are arranged between mount substrate bodies.

30. (Previous presented) The holder as claimed in claim 29, wherein one electrical connection element has one or more electrically conductive contact elements which are mounted in a sprung form and engage on correspondingly shaped contact surfaces.
31. (Previous presented) The holder as claimed in claim 28, wherein an RF coupling element for coupling two or more structure elements which are applied to a second mount substrate body is arranged on a first mount substrate body.
32. (Previous presented) The holder as claimed in claim 28, wherein the mount substrate body is composed of a flexible material.
33. (Previous presented) The holder as claimed in claim 28, wherein the mount substrate body has one or more internal milled areas which are arranged between the conductor surfaces of coupling structure elements.
34. (Cancelled)
